Math Tutoring

+ − × ÷ =

Tutoring for math classes as well as subjects and research that apply it.

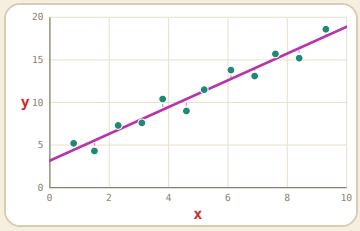

For students in math, biology, engineering, business and beyond who want to understand how the math they are learning applies to their field and communicate their results simply.

An example

A common problem: we collect **data points** to mark how changing something in an environment (**x axis**) affects outcomes within that environment (**y axis**).

How math helps: we find a **line** that best fits these **data points** so we can understand how our interactions affect the system generally.

Interpreting the solution: `y = 3.2 + 1.6x`

`BIOLOGY (x: fertilizer (g), y: plant height (cm))`
Each extra gram of fertilizer adds 1.6 cm of height.

`ENGINEERING (x: load (kN), y: beam deflection (mm))`
Each extra kilonewton of load bends the beam 1.6 mm more.

`BUSINESS ($x: ad spend ($k), y: sales ($k))`
Each extra $1k on ads brings in $1.6k in sales.

About me

Aamir Ahmad

M.S. in Applied Mathematics
Formerly at NASA
